*"The Basho era focuses on scaling the blockchain. Voltaire, the final era, adds voting and treasury management functionality to the blockchain. Once part of Cardano's Voltaire phase, CIP-1694 was implemented through the Chang upgrade and subsequent Plomin hard fork in 2024 establishing "on-chain" governance. This transition enabled ADA token holders to create, vote on and implement proposals through a decentralized decision-making process, marking IOHK's successful transfer of network development control to the community. As with other proof-of-stake cryptocurrencies, Cardano offers "staking", which allows token holders to set-aside (delegate) tokens to potentially "validate" transactions on the same blockchain (Figure 1). The quantity of tokens staked corresponds with the likelihood of being chosen to validate a transaction, and thus be rewarded by the algorithm with more of the same token."*

*"It results in more expressive and complex contracts compared to those feasible under the basic UTXO model, bridging the gap between the UTXO and account models in terms of contract functionality. Each UTXO in the EUTXO model is associated with a data value that can change as the UTXO is consumed and new ones are created, allowing contracts to maintain state across transactions. This enriched data structure offers the EUTXO model an extended ability to facilitate smart contract development while still maintaining the immutability and auditability of the standard UTXO model. The EUTXO model is used in cryptocurrencies like the Cardano blockchain to facilitate more complex financial transactions and automated scripts. It serves as the basis for Plutus, Cardano's smart contract development platform, and allows it to handle complex, stateful contracts while maintaining a high level of security and predictability. Despite its added complexity, the EUTXO model maintains the critical advantages of the UTXO model."*
