"Coins with stored face value as high as \$1,000 have been struck in gold. The British Museum's coin collection includes four specimens from the earliest series of funded bitcoin tokens; one is currently on display in the museum's money gallery. In 2013, a Utah manufacturer of these tokens was ordered by the Financial Crimes Enforcement Network (FinCEN) to register as a money services business before producing any more funded bitcoin tokens. Hardware wallets A hardware wallet is a small and portable computer peripheral that signs transactions as requested by the user. These devices store private keys and carry out signing and encryption internally, and do not share any sensitive information with the host computer except already signed (and thus unalterable) transactions. Because hardware wallets never expose their private keys, even computers that may be compromised by malware do not have a vector to access or steal them. The user sets a passcode when setting up a hardware wallet."

"In September 2022, Ethereum, the second-largest cryptocurrency, switched from PoW to a PoS consensus mechanism, after several proposals and some delays. Concerns Centralization Critics have argued that the proof of stake will likely lead cryptocurrency blockchains being more centralized in comparison to proof of work as the system favors users who have a large amount of cryptocurrency, which in turn could lead to users who have a large amount of cryptocurrency having major influence on the management and direction for a crypto blockchain. Legal status in US US regulators have argued over the legal status of the proof-of-stake model, with the Securities and Exchange Commission claiming that staking rewards are the equivalent of interest, so coins such as ether and ada are financial securities. However, in 2024, the SEC sidestepped the question by recognising Ethereum market funds on condition that they did not stake their coins. The level of staking of ether at 27% of total supply was low compared with Cardano (66%) and Solana (63%). However, not staking their tokens meant that the funds were losing about 3% of potential returns a year."
